Boost the Anti-Cancer Impact of Vegetables

Improve Your Visual Acuity

Instant Tea for Mental Focus

Why Cancer Patients Should Bank Stem Cells

Maintain Your Bone Density
SUPER K

Comprehensive Vitamin K Formula!

Item #02334 • 90 softgels

1 bottle $22.50
4 bottles $20.25 each

Each bottle lasts for three months.

For full product description and to order Super K, call 1-800-544-4440 or visit www.LifeExtension.com

Just one daily softgel of Super K provides:

**REPORTS**

**24 HOW OSTEOPOROSIS ACCELERATES AGING**  
As bone decays, harmful inflammatory proteins are released along with growth factors that facilitate malignant cell propagation and contribute to vascular calcification.

**48 IMPROVE VISUAL ACUITY**  
Ingestion of plant carotenoids can lower risk of advanced macular degeneration by 41%. The addition of the spice saffron improves visual acuity as measured on a standard eye chart.

**58 RESEARCH OUTCOMES ON CANCER DRUGS**  
Two drugs demonstrate benefits in treating prostate and breast cancers.

**68 COFFEE ALTERNATIVE BOOSTS MENTAL FOCUS**  
A caffeine-free instant tea has been shown to improve concentration, boost short-term working memory, and help clear brain fog.

**78 CANCER PATIENTS SHOULD BANK THEIR STEM CELLS**  
Chemotherapy inflicts damage to bone marrow stem cells vital for immune function. Newly diagnosed cancer patients can benefit by storing their bone marrow stem cells prior to treatment.

**DEPARTMENTS**

**7 AS WE SEE IT**  
Death rates from cancer are down, but the number of Americans dying each year is higher than ever. A new method enables people to achieve higher blood levels of anti-cancer nutrients found in cruciferous vegetables.

**17 IN THE NEWS**  
NSAIDs boost cancer survival; compounds from curcumin and fisetin slow aging; coffee may cut risk of diabetes; vitamin-D deficiency linked to depression risk, and more.

**87 WELLNESS PROFILE**  
After suffering a stroke at 23, and recovering, Jared Firestone threw himself into one of the world’s most stressful, high-risk sports and now has set his sights on the 2022 Winter Olympics.

**91 SUPERFOODS**  
The protein, anthocyanins, and insoluble fiber in the 15 varieties of cabbage help enhance cardiovascular and digestive health, and protect against cancer.
Your Brain Health Is in Your Hands

Neuro-Mag® Magnesium L-Threonate was specifically formulated by MIT scientists to be uniquely absorbable by brain and nerve cells.

Gustavo Tovar Baez, MD, operates the Life Extension Clinic in Caracas, Venezuela. He is the first physician in Caracas to specialize in anti-aging medicine.

Ricardo Bernales, MD, is a board-certified pediatrician and general practitioner in Chicago, IL, focusing on allergies, bronchial asthma, and immunodeficiency.

Mark S. Bezek, MD, FACR, FAAR, FAAEM, is board-certified in internal medicine, emergency medicine, and anti-aging/regenerative medicine. He is the director of Med-Link Consulting, which specializes in bioidentical hormone replacement therapy, natural alternatives, anti-aging, and degenerative diseases. He holds U.S. patents for a multivitamin/mineral supplement, an Alzheimer’s/dementia compilation, and a diabetic regimen.

Thomas F. Crais, MD, FACS, a board-certified plastic surgeon, was medical director of the microsurgical research and training lab at Southern Baptist Hospital in New Orleans, LA, and currently practices in Sun Valley, ID.

William Davis, MD, is a preventive cardiologist and author of *Wheat Belly: Lose the Wheat, Lose the Weight and Find Your Path Back to Health.* He is also medical director of the online heart disease prevention and reversal program, *Track Your Plaque* (www.trackyourplaque.com).

Martin Dayton, MD, DO, practices at the Sunny Isles Medical Center in North Miami Beach, FL. His focus is on nutrition, aging, chelation therapy, holistic medicine, and oxidative medicine.

John DeLuca, MD, DC, is a 2005 graduate of St. George’s University School of Medicine. He completed his internal medicine residency at Monmouth Medical Center in Long Branch, NJ, in 2008 and is board-certified by the American Board of Internal Medicine. Dr. DeLuca is a Diplomate of the American Academy of Anti-Aging Medicine and has obtained certifications in hyperbaric medicine, pain management, nutrition, strength and conditioning, and manipulation under anesthesia.

Sergey A. Dzugan, MD, PhD, was formerly chief of cardiovascular surgery at the Donetsk Regional Medical Center in Donetsk, Ukraine. Dr. Dzugan’s current primary interests are anti-aging and biological therapy for cancer, cholesterol, and hormonal disorders.

Patrick M. Fratellone, MD, RH, is the founder and executive medical director of Fratellone Associates. He completed his internal medicine and cardiology fellowship at Lenox Hill Hospital in 1994, before becoming the medical director for the Atkins Center for Complementary Medicine.

Norman R. Gay, MD, is proprietor of the Bahamas Anti-Aging Medical Institute in Nassau, Bahamas. A former member of the Bahamian Parliament, he served as Minister of Health and Minister of Youth and Sports.

Mitchell J. Ghen, DO, PhD, holds a doctorate in holistic health and anti-aging and serves on the faculty of medicine at the Benemerita Universidad Autonoma De Puebla, Mexico, as a professor of cellular hematopoietic studies.

Gary Goldfaden, MD, is a clinical dermatologist and a lifetime member of the American Academy of Dermatology. He is the founder of Academy Dermatology of Hollywood, FL, and COSMESIS Skin Care.

Miguelangelo Gonzalez, MD, is a certified plastic and reconstructive surgeon at the Miguelangelo Plastic Surgery Clinic, Cabo San Lucas.

Gary G. Gordon, MD, DO, is a Payson, Arizona-based researcher of alternative approaches to medical problems that are unresponsive to traditional therapies. He is president of the International College of Advanced Longevity Medicine.

Richard Heifetz, MD, is a board-certified anesthesiologist in Santa Rosa, CA, specializing in the delivery of anesthesia for office-based, plastic/cosmetic surgery, chelation therapy, and pain management.

Roberto Marasi, MD, is a psychiatrist in Brescia and in Piacenza, Italy. He is involved in anti-aging strategies and weight management.

Maurice D. Marholin, DC, DO, is a licensed chiropractic physician and board-certified osteopathic family physician. While training at the University of Alabama, he completed fellowships in Clinical Nutrition and Behavioral Medicine. He is currently in private practice in Clermont, FL.

Prof. Francesco Marotta, MD, PhD, of Montenapoleone Medical Center, Milan, Italy, is a gastroenterologist and nutrigenomics expert with extensive international university experience. He is also a consulting professor at the WHO-affiliated Center for Biotech & Traditional Medicine, University of Milano, Italy and honorary resident professor, Nutrition, Texas Women’s University. He is the author of more than 130 papers and 400 lectures.

Philip Lee Miller, MD, is founder and medical director of the Los Gatos Longevity Institute in Los Gatos, CA.

Michele G. Morrow, DO, FAAFP, is a board-certified family physician who merges mainstream and alternative medicine using functional medicine concepts, nutrition, and natural approaches.

Filippo Ongaro, MD, is board-certified in anti-aging medicine and has worked for many years as flight surgeon at the European Space Agency. He is a pioneer in functional and anti-aging medicine in Italy where he also works as a journalist and a writer.

Herbert Pardell, DO, FAAIM, practices internal medicine at the Emerald Hills Medical Center in Hollywood, FL. He is a medical director of the Life Extension Foundation.

Lambert Titus K. Parker, MD, an internist and a board-certified anti-aging physician, practices integrative medicine from a human ecology perspective with emphasis on personalized brain health, biomarkers, genomics and total health optimization. He serves as the Medical Director of Integrative Longevity Institute of Virginia, a 501(c)3 Non-Profit Medical Research Institute. He also collaborates on education and research for Hampton Roads Hyperbaric Therapy.

Ross Pelton, RPh, PhD, CCN, is a scientific director for Essential Formulas, Inc.

Patrick Quillin, PhD, RD, CNS, is a clinical nutritionist in Carlsbad, CA, and formerly served as vice president of nutrition for Cancer Treatment Centers of America, where he was a consultant to the National Institutes of Health.

Allan Rashford, MD, graduated from the University of Iowa Medical School. Upon completing medical training, he became chief of medicine at St. Francis Hospital in South Carolina, and he was later named president of the Charleston Medical Society.

Marc R. Rose, MD, practices ophthalmology in Los Angeles, CA, and is president of the Rose Eye Medical Group. He is on the staff of Pacific Alliance Medical Center, Los Angeles, and other area hospitals.

Michael R. Rose, MD, a board-certified ophthalmologist with the Rose Eye Medical Group in Los Angeles, CA, is on the staff of the University of Southern California and UCLA.

Ron Rothenberg, MD, is a full clinical professor at the University of California San Diego School of Medicine and founder of California HealthSpan Institute in San Diego.

Roman Rozencwajg, MD, is a pioneer in research on melatonin and aging. He practices in Montreal, Canada, as research associate at Montreal General Hospital, Department of Medicine, McGill University.

Michael D. Seidman, MD, FACS, is the director of skull base surgery and wellness for the Adventist Health System in Celebration, FL.

Ronald L. Shuler, BS, DDS, CCN, LN, is involved in immunoncology for the prevention and treatment of cancer, human growth hormone secretagogues, and osteoporosis. He is board-certified in anti-aging medicine.

Paul Wand, MD, Fort Lauderdale, FL, is a clinical neurologist with special expertise in treating and reversing diabetic peripheral neuropathy and brain injuries from various causes.
Sandra C. Kaufmann, MD, is a fellowship-trained and board-certified pediatric anesthesiologist as well as the Chief of Anesthesia at the Joe DiMaggio Children’s Hospital in Hollywood, Florida. She is the founder of The Kaufmann Anti-Aging Institute and the author of the book *The Kaufmann Protocol: Why We Age and How to Stop it* (2018). Her expertise is in the practical application of anti-aging research.

Steven B. Harris, MD, is president and director of research at Critical Care Research, a company that grew out of 21st Century Medicine in Rancho Cucamonga, CA. Dr. Harris participates in groundbreaking hypothermia, cryothermia, and ischemia research. His research interests include antioxidant and dietary-restriction effects in animals and humans.

Richard Black, DO, is a dedicated nuclear medicine physician practicing as an independent contractor out of Cleveland, Ohio. Dr. Black is board certified in internal medicine and nuclear medicine, and is licensed to practice medicine in multiple states throughout the United States.

John Boik, PhD, is the author of two books on cancer therapy, *Cancer and Natural Medicine* (1996) and *Natural Compounds in Cancer Therapy* (2001). He earned his doctorate at the University of Texas Graduate School of Biomedical Sciences with research at the MD Anderson Cancer Center, focusing on screening models to identify promising new anti-cancer drugs. He conducted his postdoctoral training at Stanford University’s Department of Statistics.

Deborah F. Harding, MD, is founder of the Harding Anti-Aging Center. She is double board-certified in internal medicine and sleep disorder medicine. She also earned the Cenegenics certification in age management medicine. She is a faculty member of the University of Central Florida Medical School.

Sandra C. Kaufmann, MD, is chairman of the *Life Extension* Scientific Advisory board. He holds a master’s and doctorate from the Massachusetts Institute of Technology (MIT). He has specialized in human therapeutics including vaccines, monoclonal antibodies, product development, nutraceuticals, formulations, artificial intelligence, hormones, and nutritional supplementation. He has also authored articles and contributed to peer-reviewed publications and served as an editor for the Journal of Medicinal Food.

Örn Adalsteinsson, PhD, is a cardiologist specializing in congestive heart failure, primary and statin-induced diastolic dysfunction, and other heart diseases. A leading authority on coenzyme Q10, Dr. Langsjoen has been involved with its clinical application since 1983. He is a founding member of the executive committee of the International Coenzyme Q10 Association, a fellow of the American College of Cardiology, and a member of numerous other medical associations.

Peter H. Langsjoen, MD, FACC, is a dedicated nuclear medicine physician practicing as an independent contractor out of Cleveland, Ohio. Dr. Black is board certified in internal medicine and nuclear medicine, and is licensed to practice medicine in multiple states throughout the United States.

Richard Black, DO, is a dedicated nuclear medicine physician practicing as an independent contractor out of Cleveland, Ohio. Dr. Black is board certified in internal medicine and nuclear medicine, and is licensed to practice medicine in multiple states throughout the United States.

John Boik, PhD, is the author of two books on cancer therapy, *Cancer and Natural Medicine* (1996) and *Natural Compounds in Cancer Therapy* (2001). He earned his doctorate at the University of Texas Graduate School of Biomedical Sciences with research at the MD Anderson Cancer Center, focusing on screening models to identify promising new anti-cancer drugs. He conducted his postdoctoral training at Stanford University’s Department of Statistics.

Aubrey de Grey, PhD, is a biomedical gerontologist and Editor-in-Chief of *Rejuvenation Research*, the world’s highest-impact, peer-reviewed journal focused on intervention in aging. He received his BA and PhD from the University of Cambridge in 1985 and 2000 respectively. Dr. de Grey is a Fellow of both the Gerontological Society of America and the American Aging Association and sits on the editorial and scientific advisory boards of numerous journals and organizations.

Deborah F. Harding, MD, is founder of the Harding Anti-Aging Center. She is double board-certified in internal medicine and sleep disorder medicine. She also earned the Cenegenics certification in age management medicine. She is a faculty member of the University of Central Florida Medical School.

Sandra C. Kaufmann, MD, is a fellowship-trained and board-certified pediatric anesthesiologist as well as the Chief of Anesthesia at the Joe DiMaggio Children’s Hospital in Hollywood, Florida. She is the founder of The Kaufmann Anti-Aging Institute and the author of the book *The Kaufmann Protocol: Why We Age and How to Stop it* (2018). Her expertise is in the practical application of anti-aging research.

Steven B. Harris, MD, is president and director of research at Critical Care Research, a company that grew out of 21st Century Medicine in Rancho Cucamonga, CA. Dr. Harris participates in groundbreaking hypothermia, cryothermia, and ischemia research. His research interests include antioxidant and dietary-restriction effects in animals and humans.

Peter H. Langsjoen, MD, FACC, is a cardiologist specializing in congestive heart failure, primary and statin-induced diastolic dysfunction, and other heart diseases. A leading authority on coenzyme Q10, Dr. Langsjoen has been involved with its clinical application since 1983. He is a founding member of the executive committee of the International Coenzyme Q10 Association, a fellow of the American College of Cardiology, and a member of numerous other medical associations.

Diparine Maharaj MD, MB, ChB, FRCP (Glasgow), FRCP (Edinburgh), FRCPath., FACP

Dr. Diparine Maharaj is the Medical Director of the South Florida Bone Marrow Stem Cell Transplant Institute and is regarded as one of the world’s foremost experts on adult stem cells. He received his medical degree in 1978 from the University of Glasgow Medical School, Scotland. He completed his internship and residency in Internal Medicine and Hematology at the University’s Royal Infirmary.

L. Ray Matthews, MD, FACS, is a professor of surgery and director of Surgical Critical Care at Morehouse School of Medicine in Atlanta, GA, and a trauma and critical care surgeon at Grady Memorial Hospital. He has published widely and is known as one of the top vitamin D experts. Dr. Matthews has spoken before the U.S. Food and Drug Administration several times, presenting a recent update about clinical research on vitamin D.

Ralph W. Moss, PhD, is the author of books such as *Antioxidants Against Cancer, Cancer Therapy, Questioning Chemotherapy*, and *The Cancer Industry*, as well as the award-winning PBS documentary *The Cancer War*. Dr. Moss has independently evaluated the claims of various cancer treatments and currently directs The Moss Reports, an updated library of detailed reports on more than 200 varieties of cancer diagnoses.

Michael D. Ozner, MD, FACC, FAHA, is a board-certified cardiologist who specializes in cardiovascular disease prevention. He serves as medical director for the Cardiovascular Prevention Institute of South Florida and is a noted national speaker on heart disease prevention. Dr. Ozner is also author of *The Great American Heart Hoax, The Complete Mediterranean Diet and Heart Attack Proof*. For more information visit www.drozner.com.

Jonathan V. Wright, MD, is medical director of the Tahoma Clinic in Tukwila, WA. He received his MD from the University of Michigan and has taught natural biochemical medical treatments since 1983. Dr. Wright pioneered the use of bioidentical estrogens and DHEA in daily medical practice. He has authored or co-authored 14 books, selling more than 1.5 million copies.

Xiaoxi Wei, PhD, is a chemist, expert in supramolecular assembly and development of synthetic transmembrane nanopores with distinguished selectivity via biomimetic nanoscience. She has expertise in ion channel function and characterization. She founded X-Therma Inc., a company developing a radical new highway towards non-toxic, hyper-effective antifreeze agents to fight unwanted ice formation in regenerative medicine and reduce mechanical icing.
Normal **aging** results in a **decline** in a cell enzyme called **AMPK**.

As **AMPK** levels drop, a cell protein called **mTOR** **increases**.

Excess **mTOR** is associated with undesirable effects related to normal **aging**.

When **mTOR** is elevated, **weight loss** may be more difficult.

When cellular **AMPK** is **increased**, excess **mTOR** **decreases**.

**AMPK Metabolic Activator** is a dual-nutrient formula to support healthy **AMPK** activation.

For full product description and to order **AMPK Metabolic Activator**, call 1-800-544-4440 or visit [www.LifeExtension.com](http://www.LifeExtension.com)

**ActivAMP**® is a registered trademark of Gencor.

This supplement should be taken in conjunction with a healthy diet and regular exercise program. Individual results may vary and are not guaranteed.

These statements have not been evaluated by the Food and Drug Administration. This product is not intended to diagnose, treat, cure, or prevent any disease.
The American Cancer Society made a big announcement earlier this year:

**Cancer death rates** for men and women plummeted 27% between 1991 and 2016.¹

This is exciting news but overlooks the fact that more Americans are dying of cancer than ever before.² A record 607,000 cancer deaths will occur in the United States this year.¹

Not factored into these numbers are side effects inflicted by surgery, radiation, chemotherapy, and newer immune-modulating drugs like Keytruda⁶.

These side effects go beyond the miseries suffered during conventional treatment. Many patients exposed to these therapies are at increased risk of heart failure and secondary malignancies.

For example, breast cancer patients treated with radiation and certain chemo drugs have up to a 4.2-fold increased risk of leukemia that is often difficult to cure.³

So, while cancer death rates declined 27% since 1991, more Americans than ever before are being diagnosed with cancer and aggressively treated.

We at Life Extension® advocate for proactive prevention. A lot starts with healthy diet, including consumption of cruciferous vegetables that are rich in cancer-fighting compounds.⁴

In a major advance, a new cruciferous vegetable formula enables people to achieve higher blood levels of anti-cancer nutrients than ever before.

Transformative potential now exists to reduce the number of newly diagnosed malignancies, as opposed to more effectively treating those who fall victim.
Cruciferous vegetables have long been known to reduce one’s risk of developing cancer.\(^5,6\) A partial list of cruciferous vegetables includes **kale, cabbage, Brussels sprouts, cauliflower, watercress,** and **broccoli.** These plants contain anti-cancer components, as demonstrated by hundreds of published studies.\(^9,10\)

The challenge has been to identify growing conditions, cooking methods, and even how to eat these plants in order to obtain optimal amounts of active anti-cancer compounds.\(^11\)

**Why Vegetable “Sprouts and Seeds” Are Beneficial**

Vegetables undergo a maturation process whereby their biochemistry changes with age.

As vegetables sprout from seeds, they naturally express nutrients that have been shown to be especially protective against cancers. **Broccoli sprouts and seeds** contain huge amounts of a compound called glucoraphanin and a critical enzyme called myrosinase.

This enzyme is needed to transform glucoraphanin into an anti-cancer compound called sulforaphane.\(^12\)

The sequence is as follows:

```
BROCCOLI SEEDS or SPROUTS ➔ GLUCORAPHANIN ➔ MYROSINASE ➔ SULFORAPHANE
```

The glucoraphanin content of broccoli dramatically diminishes as the plant grows into the familiar vegetable we see at the market.\(^12\)

Excited by the anti-cancer potential of glucoraphanin, researchers began to study broccoli sprouts to better understand potential therapeutic applications.

**Formation Pathway of Anti-Cancer Compounds In Cruciferous Vegetables**

Broccoli sprouts and seeds contain large amounts of glucoraphanin that is converted by the myrosinase enzyme into an anti-cancer compound called sulforaphane.\(^12-14\)

Mature broccoli also contains these anti-cancer compounds, but in far smaller amounts.

**How Sulforaphane Was Discovered**

In 1992,\(^15\) scientists at Johns Hopkins showed that three-day-old broccoli sprouts contain 10 to 100 times higher the amount of anti-cancer compounds compared to mature broccoli.\(^12\)

These scientists were the first to isolate and patent high-potency sulforaphane for its cancer prevention properties.\(^16,17\)

They showed that female rats administered sulforaphane developed fewer, smaller, and slower growing tumors compared with controls. This study found that after rats were exposed to a potent carcinogen, a double dose of sulforaphane reduced tumor incidence and number by more than 50% compared with controls.\(^18\)

Researchers later discovered that broccoli seeds have an even higher content of glucoraphanin than broccoli sprouts.\(^19\)

**Most People Eat Broccoli Wrong**

More people eat broccoli today than ever before. Yet few derive maximum benefits.

One reason is that the cooking of broccoli reduces broccoli’s beneficial components. These include glucoraphanin and myrosinase that convert to biologically-active sulforaphane.\(^20\)
Another cruciferous compound is I3C (indole-3-carbinol). It also requires the myrosinase enzyme to fully activate. I3C has demonstrated profound anti-cancer effects in rats. I21
I3C itself is not particularly stable, but quickly converts to a beneficial compound called DIM (3,3’-diindolylmethane). DIM has demonstrated hormone-modulating properties that have cancer-fighting effects.22,23
To derive maximum benefits from broccoli sprouts or mature florets, eat them raw and chew them well.
A less expensive and more convenient method is to ingest a new cruciferous formula that delivers higher potencies of sulforaphane and DIM into the human bloodstream.

Take-Home Lesson About Sulforaphane

Published studies show sulforaphane is the compound in broccoli with the most demonstrated cell-protecting benefits.24-36
The amount of sulforaphane people obtain when eating mature broccoli or even broccoli sprouts is trivial when compared to a newly designed cruciferous formula.37,38
To understand why people aren’t benefiting more from cruciferous vegetables, one must understand limitations that prevent significant amounts of anti-cancer compounds from being delivered into the bloodstream.
In the broccoli plant there are separate cell compartments that contain glucoraphanin and the enzyme myrosinase.39
With chewing, these broccoli cell compartments rupture and glucoraphanin is exposed to the myrosinase enzyme that converts it to sulforaphane.

Cancer Risk Reduction with Cruciferous Vegetables

The following percentages of cancer risk reduction are based on dietary intake of people ingesting the highest versus the lowest amounts of cruciferous vegetables.
They do not reflect the potential benefits of a newly designed formulation that enables higher quantities of bioavailable sulforaphane to be absorbed into the blood.

</table>
Sulforaphane is absorbed into the bloodstream mostly in the small intestine.\(^{40,41}\)

When one eats broccoli, the myrosinase enzyme quickly converts glucoraphanin to sulforaphane. Beneficial sulforaphane, however, is an unstable compound that is highly susceptible to degradation.\(^{42}\)

**Why Sulforaphane Is Not Better Absorbed**

The conversion of glucoraphanin into sulforaphane varies greatly with plant maturity and freshness. A lot depends on the amount of myrosinase and glucoraphanin in a cruciferous vegetable on a given day.\(^{13,43,44}\)

Conversion to sulforaphane is never 100% because raw broccoli plants contain additional ingredients that support formation of inactive compounds rather than the beneficial sulforaphane.\(^{42}\)

Thus, only a small amount of sulforaphane from ingested broccoli makes it to the small intestine for optimal absorption into the blood.

When looking at the substantial reductions in cancer risk in people who eat the highest amount of cruciferous vegetables, there is enormous potential to prevent more cancers by delivering higher levels of sulforaphane.

A new technology does just that by keeping myrosinase and glucoraphanin separate until they reach the small intestine, where they combine to provide far higher amounts of sulforaphane.

**Reverse Gene Mutations**

Recent studies reveal cruciferous compounds regulate genes that are responsible for the uncontrolled proliferation and survival of various types of cancer cells.\(^{36,40,45}\)

The *New England Journal of Medicine* defined cancer as follows: “Cancer results from the accumulation of mutations in genes that regulate cellular proliferation.”\(^{46}\)

We now know that cruciferous compounds favorably regulate genes that control cell proliferation.

Gene regulation is one of several anti-cancer mechanisms possessed by these vegetable extracts.\(^{47}\)

Sulforaphane and DIM have been found to reverse gene mutations that are involved in cancer initiation and progression.\(^{48}\)

**Shield Against Environmental Carcinogens**

Herbicides, pesticides, drinking water, plastics, and industrial emissions contain cancer-causing toxins.\(^{58}\)

These chemicals lead to cancer by damaging our DNA and impeding our detoxification pathways.\(^{59,62}\)

It is virtually impossible to avoid the onslaught of environmental toxins.

It is possible, however, to equip your body with the tools it needs to target toxins and remove them before they cause serious damage.
Cruciferous vegetables do just that. They optimize crucial aspects of the body’s detoxification system to neutralize many chemical threats—and maintain the integrity of cellular DNA in the process.40,63,64

Decades of research show that consuming cruciferous vegetables can slash risk of cancer. These findings reveal reduced risk of virtually every major type of cancer.36,40,65

**Overcome Limitations On Cancer Risk Reduction**

There is no doubt that cruciferous vegetables contain cancer-preventing compounds.

Yet the most favorable data show only up to a 49% reduction in cancer incidence in those who eat the most broccoli, cauliflower, etc.49,50,53-57

My concern is that even people who eat plenty of vegetables still have significant cancer risks. And most people are challenged to eat lots of cruciferous vegetables on a consistent basis.

This makes the advent of the first technology that separates myrosinase from glucoraphanin so exciting. It greatly increases the amount of bioactive sulforaphane that can be readily absorbed in the small intestine.

Up until recently, myrosinase was not available in stable form. Few companies provide this enzyme together with glucoraphanin.

And no one is separating myrosinase from glucoraphanin to ensure optimal conversion to sulforaphane in the small intestine for maximum absorption.

Another limitation is that cruciferous vegetables are often cooked or frozen, which reduces the amount of glucoraphanin and destroys the myrosinase needed to transform glucoraphanin into sulforaphane.37,38

**Why Not Take Sulforaphane?**

You may ask: why not just ingest sulforaphane itself?

The reason this is not practical is that sulforaphane is highly reactive and unstable. A person would have to specially prepare and ingest fresh sulforaphane within minutes.13,66

Sulforaphane’s instability also means a limited “shelf-life” and it would be unfeasible for a supplement formula.

Thus, ideally, we don’t want sulforaphane produced until it reaches the small intestine where it gets optimally absorbed quickly.

A new formulation that compartmentalizes and then properly releases myrosinase plus glucoraphanin is the ideal method of delivering sulforaphane throughout your body.

**Transformative Potential**

When one studies the beneficial effects of sulforaphane, there is now transformative potential to reduce the number of newly diagnosed malignancies.

For newly diagnosed cancer patients, an article in this month’s issue describes the benefit of storing one’s bone marrow stem cells prior to conventional treatments.

Another article highlights how cruciferous vegetables protect against chronic inflammation, and even aging.

We also present recent findings on two drugs that show improved survival in breast and prostate cancer patients, and describe how excess bone loss can fuel cancer cell propagation.

Despite these favorable discoveries, more than 600,000 Americans are losing their lives each year in this ongoing cancer “war.”

We at Life Extension® advocate for more cancer research and intelligent translation of favorable findings into clinical practice, so that more human lives can be spared.

For longer life,

William Faloon, Co-Founder
Life Extension® Buyers Club

Life Extension’s
Ultra Prostate Formula can help:

- Support healthy urination
- Promote healthy prostate size and function
- Encourage healthy inflammatory response
- Help inhibit PSA activity

"Thanks, Ultra Prostate Formula."

For full product description and to order Ultra Prostate Formula, call 1-800-544-4440 or visit www.LifeExtension.com

Item #02029 • 60 softgels
1 bottle $28.50
4 bottles $26.25 each

These statements have not been evaluated by the Food and Drug Administration. This product is not intended to diagnose, treat, cure or prevent any disease.
Optimized Broccoli and Cruciferous Blend utilizes an innovative delivery system to assure maximum bioavailability.

Each enteric coated, dual-layer tablet contains extracts of broccoli, watercress, cabbage, and rosemary to deliver:

- Glucoraphanin and myrosinase (separated until they reach the small intestine) to produce sulforaphane. Published studies describe how sulforaphane promotes healthy DNA and normal cell division.
- DIM (di-indolyl-methane) to induce liver detoxification enzymes that help neutralize estrogen metabolites and estrogen-like environmental hazards.

Just one easy-to-take, dual-layered tablet daily provides potent benefits of fresh cruciferous vegetables.
Most Complete Omega-3
FISH OIL FORMULA

Fish oil boosts blood levels of EPA and DHA omega-3 fatty acids.

Few people take enough fish oil to obtain optimal levels of EPA/DHA.

Super Omega-3 formulas provide higher EPA/DHA potencies PLUS additional components found in Mediterranean style diets.

Our most advanced fish oil formula provides:

1. EPA/DHA Fish Oil (ultra-pure/ double-potency)
2. Olive polyphenols (to inhibit LDL oxidation)
3. Sesame lignans (to extend stability of DHA in the blood)
4. Astaxanthin (protects against lipid peroxidation)
5. Krill oil (a source of EPA/DHA)

Item #01988 - 120 softgels
1 bottle $33.75
4 bottles $31.50 each

For full product description and to order Super Omega-3 Plus EPA/DHA with Sesame Lignans, Olive Extract, Krill & Astaxanthin, call 1-800-544-4440 or visit www.LifeExtension.com

Inadequate Fruit and Vegetable Intake Results in Millions of Deaths Worldwide

**Low fruit intake** causes 1 in 7 deaths from heart disease, and **low vegetable intake** causes 1 in 12 deaths from heart disease, according to research presented at the annual meeting of the American Society for Nutrition.*

Researchers analyzed diet surveys and food availability data from 113 countries and combined them with data on causes of death and cardiovascular risk linked to low fruit and vegetable intake.

They found that **low fruit consumption** resulted in more than 1 million deaths from stroke, and more than 500,000 deaths from cardiovascular disease per year worldwide.

And **low vegetable consumption** resulted in more than 200,000 deaths from stroke and more than 800,000 deaths from cardiovascular disease per year worldwide.

Fruit intake was lowest among people in South and East Asia and Sub-Saharan Africa, and vegetable intake was lowest in Central Asia and Oceania.

Federal guidelines recommend consuming **1.5-2 cups** of fruit and **2-3 cups** of vegetables per day, yet only 1 in 10 adults meets these recommendations, according to the Centers for Disease Control and Prevention.

**Editor’s Note:** “These findings indicate a need to expand the focus to increasing availability and consumption of protective foods like fruits, vegetables, and legumes – a positive message with tremendous potential for improving global health,” said study author Dariush Mazaffarian.

Salk Institute Team Develops Fisetin, Curcumin, Compounds that Slow Aging

An article published in *Trends in Pharmacological Sciences* reported that researchers from the Salk Institute in La Jolla, CA have synthesized potential treatments for Alzheimer’s and other neurodegenerative diseases from two compounds that have already been identified as geroprotectors.*

Dr. David Schubert and his colleagues explained that, “Geroprotectors are compounds that slow the rate of biological aging and therefore may reduce the incidence of age-associated diseases such as Alzheimer’s disease.”

Starting with the geroprotectors curcumin (which is derived from turmeric) and fisetin (found in strawberries and other fruits and vegetables), the researchers synthesized three compounds labeled CMS121, CAD31, and J147. These compounds and their parent compounds, dubbed “geroneuroprotectors,” decreased molecular markers of aging and dementia in mice and flies and extended their median lifespan.

“If these drugs have benefits for other body systems, such as maintaining kidney function and overall muscle health, they could be used in additional ways to treat or prevent the diseases of aging,” Dr. Schubert said.

*Editor’s Note:* Senior author Dr. Pamela Maher noted that, “Since we found that the natural products curcumin and fisetin are also GNPs [geroneuroprotectors] and commercially available as supplements, they could provide some therapeutic benefits right now.”

Vitamin-D Deficient Older Adults May have Greater Odds of Developing Depression

Researchers at Trinity College in Dublin, Ireland reported a 75% increase in the likelihood of developing depression among older individuals with deficient levels of vitamin D.

The investigation included 3,965 participants aged 50 and older who participated in the Irish Longitudinal Study on Aging. Blood levels of vitamin D were measured on enrollment and the presence of depression was evaluated at two and four years.

Being deficient in vitamin D was associated with a 75% increase in the likelihood of developing depression over the follow-up period than for people who had nondeficient levels.

“This is the largest representative and most comprehensive study of depression risk and vitamin D status in older adults ever conducted in Ireland,” stated first author Dr. Robert Briggs. “Our findings will provide useful information to help inform public health policy—particularly regarding the proposition of the usefulness of vitamin D treatment/supplementation for depression.”

Editor’s Note: Senior author Dr. Eamon Laird said that, “This study shows that vitamin D is associated with a health condition other than bone health. What is surprising is the large effect on depression even after accounting for other control variables.”

Drinking Coffee May Reduce Risk of Developing Type II Diabetes

The results of a meta-analysis of more than one million subjects, reported in *Nutrition Reviews*, indicated that the risk of developing type II diabetes was lower in coffee drinkers in comparison with individuals who didn’t drink coffee.*

Researchers analyzed data from 30 prospective studies published through 2017 that included a total of 1,185,210 people, 53,018 of whom had developed type II diabetes.

A pooled analysis of the subjects revealed a 29% lower risk of developing diabetes in those who were in the highest category of coffee consumption (at a median intake of *five cups per day*) compared to the group who drank no coffee. For every cup per day increase in caffeinated coffee consumption, the risk of developing type II diabetes was lowered by 7%. Drinking decaffeinated coffee lowered the risk of type II diabetes by 6% per additional cup.

**Editor’s Note:** The researchers concluded that, “Available evidence indicates that coffee consumption is inversely associated with risk of T2D [type II diabetes]. Possible mechanisms behind this association include thermogenic, antioxidative, and anti-inflammatory effects; modulation of adenosine receptor signaling; and microbiome content and diversity.”

Use of Aspirin, Ibuprofen, May Improve Survival Rates for Head and Neck Cancer

Regular use of common, over-the-counter pain relievers can improve the survival rates of patients with certain head and neck cancers, according to an article published in The Journal of Experimental Medicine.*

The study, with a cohort of 266 patients, was led by University of California San Francisco researchers who studied the medical records of the individuals and tissue samples from their surgically-removed tumors.

The results showed that patients whose cancer contained a specific, altered gene, known as PIK3CA (phosphoinositide-3-kinase, catalytic, alpha polypeptide), and who regularly took non-steroidal, anti-inflammatory drugs (NSAIDs) such as aspirin and ibuprofen, for at least six months, had markedly improved survival rates. Patients whose tumors did not contain the altered gene did not benefit from regular NSAID use.

The overall, five-year survival rate for head and neck cancer, about 45%, rose to 78% in patients in this cohort who had the altered gene and used NSAIDs. Most of the patients who regularly used NSAIDs began to do so after receiving the diagnosis of their disease.

The researchers concluded that further study is warranted in a randomized, clinical trial.

Editor’s Note: “Our results suggest that the use of NSAIDs could significantly improve outcomes for not only head and neck cancer patients, but also patients with other cancers that contained the PIK3CA mutation,” said senior author Dr. Jennifer R. Grandis.

Caution: Individuals consuming more than 2,000 IU/day of vitamin D (from diet and supplements) should periodically obtain a serum 25-hydroxy vitamin D measurement. Do not exceed 10,000 IU per day unless recommended by your doctor. Vitamin D supplementation is not recommended for individuals with high blood calcium levels.

POTASSIUM with Extend-Release MAGNESIUM

Magnesium is a major factor in promoting a healthy cardiovascular system.

Research suggests when magnesium and potassium are combined there is greater support for healthy blood pressure levels that are already within the normal range.

Potassium with Extend-Release Magnesium provides 250 mg of two forms of magnesium plus 99 mg of potassium.

One form of magnesium is immediate-release while the other is coated in a proprietary encapsulation technology to release magnesium over a 6-hour period.

Take one capsule once or twice daily.

For full product description and to order Potassium with Extend-Release Magnesium, call 1-800-544-4440 or visit www.LifeExtension.com

OSTEOPOROSIS
Accelerates Body-Wide Aging

BY SUZANNE RAMOS

Osteoporosis affects a staggering number of men and women. Among those 50 and older, 30% of women and 16% of men have osteoporosis.

In people over 80, those figures skyrocket to 77% of women and 46% of men.¹

The disease causes bones to become weak, brittle, and prone to breaking.

But those aren’t the only dangers.

New evidence shows that having osteoporosis is associated with accelerated aging along with an increased risk of developing cardiovascular disease, cancer, and dementia.

Osteoporosis-induced age acceleration begins in the early stages of bone loss, before most people even know they have it.

Aging bones contain harmful senescent cells—cells that have stopped replicating, and release destructive signaling molecules.²³

As these inflammatory signals travel through the body they induce a host of degenerative disorders, including dementia and cancer.⁴⁷

Most readers of this magazine take steps to preserve their bone density.
How Bone Loss Speeds Aging

Healthy bone is constantly being remodeled. Old bone is broken down and new bone is made. Cells that build bone are called osteoblasts. Cells that break down bone are called osteoclasts.

In young, growing bodies, osteoblast activity surpasses osteoclast activity. In healthy adulthood, the activities are roughly balanced.

But as we age, osteoclast activity begins to exceed osteoblast activity. That leads to bone mineral loss, contributing to higher risk of fractures.

In people suffering from osteoporosis, the activity of osteoclasts is especially high.

Researchers have learned that osteoclasts send out signals that can promote system-wide inflammation.8-11 Chronic inflammation increases risks for cardiovascular disease, cancer, and dementia, and the acceleration of aging.12

Aging bones are a site where senescent cells accumulate with aging.13 These senescent cellsdamage bones by increasing bone resorption (breakdown) while decreasing new bone formation (the definition of osteoporosis).

Senescent cells and the harmful products they release contribute not only to osteoporosis, but also Alzheimer’s, type II diabetes, cancer, and cardiovascular disease.4,13-15

Osteoporosis and Heart Disease

Osteoporosis increases the risk of cardiovascular disease in ways that go beyond inflammation.

In one study, scientists examined heavily calcified arteries, a major contributor to arterial stiffening and cardiovascular disease, and determined that actual bone was present 6% of the time.16

Osteoclast-like cells are often found in plaque deposits in the arteries,17,18 In osteoporosis patients, a marker of inflammation has been shown to be elevated, along with an increased risk for cardiovascular disease.19

Vitamin K2 helps prevent this type of arterial calcification.20

Osteoporosis and Dementia

People with Alzheimer’s disease frequently have low bone mineral density and a higher rate of hip fractures compared to non-Alzheimer’s patients.21

Alzheimer’s disease prevalence is also higher in postmenopausal women with severe osteoporosis, especially those with femoral fractures, than in those without osteoporosis.22 These findings suggest close connections between the two apparently different conditions.
Eight Bone-Building Nutrients

Researchers have identified eight nutrients that safely help protect our bones — and can prevent osteoporosis-induced age acceleration.

CALCIUM

Calcium is the mineral most of us associate with building strong, healthy bones. Yet many Americans get too little calcium from their diets, with adults 50 and over at particular risk.28

Many different types of calcium supplements are available. But some, like calcium carbonate, don’t release a lot of calcium into the body to meet daily requirements.29 Calcium bisglycinate is better absorbed than calcium carbonate,30 as is calcium fructoborate.

Calcium bisglycinate is completely released into the gut in less than 150 minutes, while calcium carbonate takes four hours and still may not be entirely absorbed.29

Calcium fructoborate is also easily absorbed and provides extra anti-inflammatory benefits that combat the age acceleration brought on by osteoporosis.

MAGNESIUM

Magnesium supplementation increases bone mineral density.31

But about half of all Americans fail to consume enough of this vital mineral, and more than 40% of post-menopausal women have low magnesium levels in their blood. That puts them at high risk for bone breakdown and the problems that result.32-34

One study showed that magnesium supplementation for 30 days raises blood markers of new bone formation and reduces markers of bone breakdown.34

MANGANESE

Manganese plays a role in bone health and likely protects against osteoporosis. It may also protect against osteoarthritis.35

Manganese is a required cofactor, or helper molecule, for enzymes called superoxide dismutases that protect mitochondria from accumulated free-radical damage.36

Supplementation with manganese raises superoxide dismutase levels in animal models, resulting in improvements in tissue structure and function.37 Manganese supplementation has been shown to help prevent diet-induced diabetes in mice.38

Key Nutrients Protect Bone Health

- Osteoporosis weakens the bones of millions of aging women and men in America, markedly increasing their risk of fractures.
- Studies now show that the process of bone breakdown releases potent pro-inflammatory molecules throughout the body.
- Increased inflammation raises the risk for disease and contributes directly to an acceleration of the aging process.
- Supplementation with eight different nutrients known to protect the bones, including calcium, magnesium, vitamin D, and vitamin K, can help combat osteoporosis, fight inflammation, and slow aging.
VITAMIN D

Vitamin D deficiency is a major contributor to osteoporosis. More than 60% of U.S. adults have either deficient (less than 20 ng/mL) or insufficient (20-30 ng/mL) vitamin D levels, and these numbers are even higher in older people.39,40

Vitamin D also influences functioning of many different organs, so deficiency can induce:41

- Muscle weakening,
- Cardiovascular disease,
- Type II diabetes, and
- Lower cognitive functioning.

That is why experts now say that year-round vitamin D supplementation is crucial in the elderly.41

Vitamin D supplementation has produced improvement in arterial stiffness and endothelial function in people at high risk for diabetes, helping reduce the risk of heart attack or stroke.42,43

A recent animal study found that vitamin D supplementation lowered blood pressure, improved heart function, and prevented liver damage in rats fed a typical Western diet, laden with fat and sugar.44

Much of this benefit comes from a reduction in pro-inflammatory signaling molecules, including those released from osteoclasts during bone breakdown.45,46

VITAMIN K

Vitamin K plays a major role in balancing bone formation and destruction.47

Vitamin K supports increased calcium deposition in bones, while reducing its accumulation in blood vessel walls. This means it reduces osteoporosis and atherosclerosis risk.47

Studies show that vitamin K2 supplementation helps prevent bone deterioration, decreasing the release of inflammatory cytokines that increase aging in all tissues.48,49

In those with chronic kidney disease, supplementation with K2 plus vitamin D slows arterial thickening and progress of atherosclerosis.50

ZINC

Zinc is a mineral critical for supporting healthy protein synthesis, which, when diminished, contributes to osteoporosis.51,52

Zinc deficiency exacerbates the inflammation brought on by bone breakdown, while supplementation in animal models lowers inflammation.53

Human studies show that zinc supplementation is essential for normal tissue maintenance in older adults. It decreases markers of bone resorption (when bone is broken down and the minerals are released into the blood), limiting release of inflammatory compounds from bone.51,54
Recently, zinc has also been shown to promote maturation of bone-forming osteoblasts in animal and preclinical models, supporting bone health and mitigating the age-accelerating effects of bone breakdown.54,55

BORON

A deficiency in the mineral boron is associated with poor immune function and elevated risk for osteoporosis.56,57

Animal studies have shown that boron supplementation can slow bone resorption and enhance new bone formation, fighting osteoporosis.58-61

One human study found sharp reductions in bone-released inflammatory cytokines after supplementation with boron, helping mitigate osteoporosis-induced inflammation and damage to other organ systems.62

SILICON

Higher intake of the mineral silicon correlates with healthier bones.63,64

Animal studies show that supplementation with a water-soluble form of silicon may slow the rapid bone turnover in osteoporosis, preventing the bone-breakdown-associated inflammation that causes disease and speeds aging.65,66

Lab studies of isolated cells further show that silicon stimulates formation of proteins vital to forming the protein-mineral matrix of bones. It also enhances the maturation of bone-forming osteoblasts.67

Summary

Osteoporosis, the gradual loss of bone mineral density, is not only harmful to bones, but to the entire body as well.

Bone-resorbing cells eat their way into mineralized bone, releasing it into the bloodstream, where it can wind up in arteries and other tissues, impeding their function. Those cells also release powerful inflammatory compounds that fuel harmful inflammation throughout the body.

This type of chronic inflammation raises risks for cardiovascular disease, cancer, and dementia, and accelerates certain aging processes.

Scientists now recognize at least eight different, essential nutrients with powerful bone-protecting properties: calcium, magnesium, manganese, vitamin D, vitamin K, zinc, boron, and silicon.

These nutrients also help temper inflammation and lessen the impact of bone degeneration on the body.

Anyone interested in supporting skeletal health and preventing osteoporosis-induced aging should explore supplementation with these low-cost nutrients.

Most of a coffee bean’s polyphenol content is destroyed during the typical roasting process.

Among the most beneficial of these polyphenols is chlorogenic acid.

Rainforest Blend coffee utilizes the patented Healthy Roast® process, which retains the naturally occurring polyphenols like chlorogenic acid.

**A Patented Organic Roast**

Life Extension® Rainforest Blends are made using a patented, 100% natural process consisting of USDA certified organic arabica coffee beans.

**Savory Taste Without Stomach Upset**

The HealthyRoast® process also preserves special, naturally occurring compounds in coffee that soothe your stomach.

**Tasty Decaf**

Rainforest Blend is also available in a decaffeinated blend. The caffeine is removed through a chemical-free water process. It delivers the full flavor, aroma, and body of the arabica bean.

PREVENTION: The Best Strategy for Avoiding Cancer
As the “war on cancer” drags on, the National Cancer Institute estimates that 1.7 million Americans were diagnosed with cancer last year.¹

Doesn’t sound like much progress has been made since the “war” was declared by the U.S. government in 1971.

But there is hope that lies in prevention. Scientists agree that preventing cancer is the best strategy.

As many as 90% of all cancers are caused by environmental factors and lifestyle behaviors.²,³

Ongoing research points to anti-cancer effects of compounds found in broccoli and other cruciferous vegetables.

Studies show that higher intake of cruciferous vegetables is associated with a reduced risk for different types of cancers.⁴,⁵

But to maximize the effects of these cancer-fighting compounds, you’d have to consume an enormous quantity of raw vegetables.

Scientists have discovered a way to remedy this problem. They have developed a delivery system to maximize the amounts of cancer-fighting compounds in cruciferous vegetables that enter the bloodstream.
Only when the vegetables have been eaten and partially digested do they mix in the body and form sulforaphane, the beneficial compound.

Once formed, sulforaphane must be absorbed rapidly in the small intestine or it will be lost.

A Solution Inspired by Nature

Scientists have found a way to deliver both glucoraphanin and myrosinase, isolated from broccoli, separately to the small intestine.

In the small intestine, these two components mix and form sulforaphane, which can be immediately absorbed into the body, achieving higher blood levels of this anti-cancer compound.

In a study done by scientists at Johns Hopkins, healthy individuals were given either glucoraphanin alone or in combination with the enzyme myrosinase. Urinary metabolites of sulforaphane were used to assess bioavailability.

The bioavailability of the combination of glucoraphanin and myrosinase was 35% compared to 10% in the group given only glucoraphanin.9

Sulforaphane and DIM Research

For decades, studies have shown that large dietary intakes of cruciferous vegetables reduce the risk of developing different forms of cancer, including many of the most common types, such as lung and colorectal cancer.5,10,11

Chemistry of Cruciferous Vegetables

Cruciferous vegetables are a group of edible plants that include broccoli, kale, green and red cabbage, cauliflower, and Brussels sprouts.

These vegetables are loaded with nutrients shown to help prevent a wide variety of common disorders.

In particular, cruciferous vegetables have a profound ability to shield cells from several processes that can transform healthy cells into malignant tumors.4,5

Two cruciferous nutrients are especially well validated: sulforaphane and 3,3’-diindolylmethane (DIM). The benefits of both are supported by ample medical literature.6-8

DIM is a stable compound that is readily absorbed from the digestive system.

Sulforaphane, however, is very unstable, which means it rapidly degrades into non-active substances if it isn’t quickly absorbed, or if the vegetable is heavily cooked.

Nature has found a way around this problem.

How Plants Make Sulforaphane

Sulforaphane itself isn’t contained in broccoli and cabbage.

Instead, a precursor called glucoraphanin is stored in these plant cells, along with an enzyme, myrosinase, that converts the glucoraphanin into sulforaphane.

In raw vegetables, glucoraphanin and myrosinase are stored in separate compartments.
Researchers have also evaluated the individual compounds derived from these vegetables, most importantly sulforaphane and DIM.

Scientists at the Johns Hopkins University School of Medicine compared two different groups of rats; one was given sulforaphane and one was not.12 Both groups were then given a potent carcinogen, a chemical that produces cancerous tumors at a high rate. They found that the animals given sulforaphane developed 39% fewer tumors. In addition, the tumors that did develop were smaller and grew more slowly.

In human cancer cell lines, including breast cancer and leukemia, sulforaphane was shown to halt the growth of the tumors and to kill tumor cells.8

The benefit of DIM supplementation has been evaluated in two studies of women with a history of breast cancer.13,14 In both studies, women were randomized to receive DIM supplementation (108 mg per day in one, 300 mg per day in the other) or a placebo. DIM was found to significantly alter the mix of estrogen types, supporting an increase in “good” estrogen and reducing “bad” estrogen, which is linked to cancer progression.

DIM has also been evaluated in women for prevention of cervical cancer.6,10 Cervical intraepithelial neoplasia is a cervical cancer precursor.

In one study, women with cervical intraepithelial neoplasia were randomized to receive either 100 mg of DIM, 200 mg of DIM, or a placebo. After 90 to 180 days of supplementation researchers found that all patients’ cervical intraepithelial neoplasia resolved completely with the 200 mg dose of DIM. With the lower 100 mg dose of DIM, 90.5% regressed.6

What this shows is that these compounds, derived from cruciferous vegetables, can both prevent cancer and reverse the progression of cells that are already abnormal.
Four Ways Cruciferous Vegetables Protect Against Cancer

Cancer results from damage to genes that causes cells to multiply out of control. Toxins and pollutants in the air we breathe, the water we drink, and the food we eat can all cause this damage. Even our own metabolism produces oxidative stress and potential toxins. Behavior such as smoking greatly increases the amount of damage that is occurring.

Methods to decrease cancer risk include:

- Protecting DNA genes from mutations (damage)
- Reducing inflammation
- Impairing ability of abnormal cells to propagate

Compounds found in cruciferous vegetables act in four major ways to prevent cancer.

1. PROTECTING AGAINST EPIGENETIC CHANGES

Cancer can be caused by epigenetic changes, the ability to “turn genes on and off.” These changes don’t alter the DNA, but they change expression patterns of genes.

Studies have shown that sulforaphane and DIM can reverse some of these cancer-associated alterations.15

Sulforaphane also reverses alterations of histone proteins involved in the regulation of genes, another epigenetic change that can contribute to cancer.16,17

2. ATTACKING CANCER CELLS

Even after a cell starts down the path to cancer, the progression can be halted or reversed.

DIM and sulforaphane have been shown to suppress the growth of tumors by interfering with abnormal signaling factors that drive cancer cells to proliferate more rapidly.12

DIM also slows the propagation of tumor cells by blocking abnormal angiogenesis, the growth of new blood vessels.18

Cancers need ample blood flow to supply oxygen and nutrients so that they can grow aggressively. By impeding this new blood vessel growth, cruciferous vegetables can help starve tumor cells.

DIM and sulforaphane also directly kill cancer cells through the process of apoptosis, programmed cell death.19,20

By turning on the genes associated with apoptosis, cruciferous vegetables initiate “suicide” of the abnormal cells, while protecting healthy, normal cells.

3. MODULATING SEX HORMONES

Some forms of the hormone estrogen can stimulate breast cancer growth in women. By modulating estrogen metabolism, DIM shifts estrogen balance to favor the healthier forms of these hormones.21
In aging men, estrogen balance is also critical. Our early observations revealed that men presenting with benign prostate enlargement or prostate cancer had higher blood estrogen levels.\textsuperscript{22,23} Subsequent clinical and laboratory studies helped confirm our early observations.\textsuperscript{24-28} DIM can prevent stimulation of prostate cancer cells by estrogen.\textsuperscript{29,30}

4. INHIBITING NF-κB

NF-κB (nuclear factor-kappa B) is a regulator in cells that activates inflammation, including the low-grade chronic inflammation that is a major contributor to most age-related diseases, including cancer.

Sulforaphane blocks NF-κB, thereby reducing inflammation that contributes to cancer growth.\textsuperscript{31}

By reducing NF-κB activity, sulforaphane also has a powerful impact on other chronic diseases, and aging in general. For example, in animal models it can reduce inflammation in the brain that contributes to Alzheimer’s and Parkinson’s diseases.\textsuperscript{32,33}

Summary

High dietary intake of raw cruciferous vegetables such as broccoli, cabbage, and cauliflower, is associated with a reduced risk for many types of cancer and other disorders.

Studies have demonstrated that many of the anticancer effects are due to two compounds derived from these vegetables: sulforaphane and DIM.

These cruciferous compounds target cancer at different points in its development and progression, reducing the risk of cancer formation in the first place, and halting the progression of some tumor cells.

While DIM is stable and easily absorbed when taken orally, sulforaphane is rapidly converted to inactive compounds.

To solve this problem, scientists have developed a delivery system (glucoraphanin plus myrosinase) that maximizes the amount of sulforaphane available for absorption into the bloodstream.

By separating these precursor plant compounds, much more sulforaphane becomes bioavailable in the small intestine. There, it can be rapidly absorbed, delivering higher blood levels of this anti-cancer (sulforaphane) compound.

FEED YOUR BRAIN

FOR OPTIMAL BRAIN HEALTH

Cognitex® Elite contains clinically studied brain-boosting nutrients in one advanced formula.

A new ingredient called Sibelius™: Sage Extract demonstrated improvement in attention and memory performance in healthy, older volunteers.

Cognitex® Elite provides all of these ingredients:

- Sibelius™: Sage extract (leaf) 333 mg
- AuroraBlue® Wildcrafted 200 mg
- Blueberry Complex
- Ashwagandha extract 125 mg
- Phosphatidylserine 100 mg
- Uridine-5′-monophosphate 50 mg
- Vinpocetine 20 mg

Cognitex® Elite Pregnenolone contains these same powerful ingredients but with 50 mg of pregnenolone added.

Item #02397 - 60 vegetarian tablets
1 bottle $43.50
4 bottles $40 each

Item #02396 - 60 vegetarian tablets
1 bottle $42
4 bottles $38 each

For full product description and to order Cognitex® Elite or Cognitex® Elite Pregnenolone, call 1-800-544-4440 or visit www.LifeExtension.com

CAUTION: Consult a physician or licensed qualified health care professional before using this product if you have, or have a family history of breast cancer, prostate cancer, or other hormone-sensitive diseases. Do not take this product if you have a history of seizures. If you are taking anticoagulant or antiplatelet medications, or have a bleeding disorder, consult your healthcare provider before taking this product.

Folate helps maintain homocysteine levels within the normal range, thereby promoting cardiovascular health. Folate also supports neurotransmitter synthesis—which, in turn, helps maintain cognitive abilities.

However, not everyone has sufficient activity of the enzyme required to convert folate to its biologically active form, 5-methyltetrahydrofolate, or 5-MTHF. 5-MTHF requires no enzymatic conversion to become metabolically active—providing maximum support for both cardiovascular and cognitive health.

Optimized Folate provides metabolically active 5-MTHF folate in 1,000 mcg or 5,000 mcg strengths.

Cruciferous
VEGETABLE
BLEND

Optimized Broccoli and Cruciferous Blend utilizes an innovative delivery system to assure maximum bioavailability.

Each enteric coated, dual-layer tablet contains extracts of broccoli, watercress, cabbage, and rosemary to deliver:

- **Glucoraphanin and myrosinase** (separated until they reach the small intestine) to produce sulforaphane. Published studies describe how sulforaphane promotes healthy DNA and normal cell division.

- **DIM** (di-indolyl-methane) to induce liver detoxification enzymes that help neutralize estrogen metabolites and estrogen-like environmental hazards.

Just one easy-to-take, dual-layered tablet daily provides potent benefits of fresh cruciferous vegetables.

For full product description and to order Optimized Broccoli and Cruciferous Blend, call 1-800-544-4440 or visit www.LifeExtension.com

Item #02368
30 enteric coated tablets
1 bottle $28.50
4 bottles $26.50 each

Macular degeneration is the leading cause of irreversible vision loss in older adults.1 It happens when the macula loses structural density. The result is blinding damage to the light-sensing retina of the eye.

Primary culprits like smoking and exposure to ultraviolet sun-rays can be controlled.2-4 But the single, largest factor in its development is aging.5

Specific plant carotenoids have been shown to protect the macula from UV-light damage and oxidation.6-10

Individuals with the highest levels of the carotenoids lutein and zeaxanthin show a striking 41% lower risk of advanced age-related macular degeneration.11

A corroborating study found that saffron improved visual function in macular degeneration patients within three months. This visual enhancement occurred even among those who were already using lutein and zeaxanthin.11

Putting the brakes on macular degeneration and improved vision have been demonstrated in response to several plant-derived nutrients.11-16

Protect Against Age-Related VISION LOSS

BY MICHAEL DOWNEY
Lutein and Zeaxanthin

Two of the best-known nutrients that protect against age-related vision loss are lutein and zeaxanthin.11 They’re found in high concentrations in several parts of the eye, including the lens, retina, and macula.17,18

These yellow carotenoids absorb higher-energy (blue and ultraviolet) light, preventing it from damaging retinal tissues. Lutein and zeaxanthin also scavenge free radicals and reduce their damaging impact on retinal cells.17-20

Several clinical trials have demonstrated their effectiveness. One recent study found a reduced risk of end-stage macular degeneration, which often causes blindness, with moderate consumption of eggs — a naturally rich source of lutein and zeaxanthin.21

Other studies of adults with age-related macular degeneration demonstrated that taking 10 to 12 mg of lutein daily raises the density of protective pigmented cells in the retina by up to 175%, compared with patients taking a placebo.12,13 Increased macular density enhances the ability to protect against eye-damaging ultraviolet and blue light.

In patients with early age-related macular degeneration, 48 weeks of supplementation with either lutein alone or lutein combined with zeaxanthin produced significant increases in electroretinogram signals. This is a measure of the power of light-sensitive cells to produce electrical impulses after stimulation by light.14

A series of large, clinical trials demonstrates that lutein and/or zeaxanthin supplementation can improve retinal function, increase the ability to see contrasting colors and shapes, and improve visual acuity (the sharpness of vision at a distance).9,11,13,14,22-24

One study that lasted over 20 years included more than 102,000 people aged 50 and older. It adjusted for factors like cigarette smoking and eating patterns.

After assessing blood levels of carotenoids, scientists found that those with the highest intake of lutein and zeaxanthin had a remarkable 41% lower risk of progressing to advanced macular degeneration. High intake of lutein and zeaxanthin even protected former smokers, who tend to have a much higher incidence of macular degeneration.11

Meso-Zeaxanthin

The damaging effects of UV light are well known. But chronic exposure to blue light, the kind given off by TVs, smart phones, tablets, and computers, is also associated with increased risk of macular degeneration.25-27

Replenishing the pigments in the eye’s protective layer can quench much of the photochemical damage done by this light. In fact, research shows that progression of macular degeneration can be slowed by regular supplementation with lutein, zeaxanthin, and a third pigment, meso-zeaxanthin.28

Meso-zeaxanthin is a carotenoid needed to maintain the density of pigments in the macula. When young people consume lutein in their diet, it readily converts to meso-zeaxanthin.29
The importance of *meso*-zeaxanthin is reflected in the composition of macular pigments:

- **Lutein 50%**
- **Zeaxanthin 25%**
- **Meso-zeaxanthin 25%**

People with **macular degeneration** have **30% less meso-zeaxanthin** in their macula compared to those with good eye health.\(^30\)

When taken as a supplement, **meso-zeaxanthin** is **absorbed** into the bloodstream and **increases** macular pigment levels.\(^8\)

**Astaxanthin**

A reddish carotenoid that can be derived from marine algae, **astaxanthin** helps protect retinal cells from being damaged by oxidative and physical stress.\(^31-33\)

In experimental studies astaxanthin prevented the vision-damaging effects of **wet macular degeneration** that occurs when blood vessels leak fluid into the retina. It can also help prevent cell damage related to increased pressure in the eye, a cause of **glaucoma**.\(^32,34\)

The benefits of astaxanthin, particularly for diabetics, could be substantial. Among people who have had diabetes for over 10 years, **80%** suffer from **diabetic retinopathy**, that occurs when high levels of blood sugar cause progressive damage to the retina. Rodent studies have demonstrated that astaxanthin prevents early death of nerve cells in the retina, resulting from excess blood sugar.\(^31\)

Two human studies demonstrated that the combination of **astaxanthin, lutein, and zeaxanthin** significantly improved **visual clarity** in patients, compared with those who were untreated.\(^35,36\)

**Saffron**

A study published in 2019 found that **saffron**, a culinary spice derived from the crocus flower, enhances **visual function** in patients with **mild to moderate** age-related macular degeneration, including those already supplementing with lutein and zeaxanthin.\(^37\)

In this study, individuals took **20 mg** of **saffron** or a placebo daily for three months. Subjects who weren’t taking other supplements improved on a standard vision-measuring eye chart by .69 letters, while those already taking **lutein or zeaxanthin** improved by .73 letters.\(^37\)
This report validates earlier research demonstrating that, in people with **early** macular degeneration, **saffron** improves both visual acuity, and sensitivity of the retina to light.\textsuperscript{15,16,38}

In one study, patients with **early** age-related macular degeneration took either **20 mg** of **saffron** or a **placebo** daily. Subjects taking saffron showed stronger electrical responses to light, showing that saffron improved the light-sensing abilities of retinal cells.\textsuperscript{16}

The same study found that saffron-supplemented subjects were able to read one entire **additional line** on the eye chart after three months, while placebo subjects did not improve. This means that someone whose visual acuity at a distance was **20/40** prior to supplementation, would be able to see with **20/30** vision afterward.\textsuperscript{16}

To determine whether it could produce long-term effects, scientists gave **20 mg** of saffron per day to patients with **early** macular degeneration over an average treatment period of **14 months**. Retinal sensitivity remained improved for the entire period, and average visual acuity improved by an astounding **two lines** on the eye chart, showing that **longer** supplementation produced even greater improvement.\textsuperscript{15}

**Alpha-Carotene**

**Alpha-carotene** protects the pigmented cells of the retina from light-induced oxidative damage.

A large study was conducted on 63,443 women and 38,603 men, aged 50 and older. The results showed that people with the **highest** dietary intake of alpha-carotene had a **32%** reduced risk for developing **advanced** age-related macular degeneration, compared with those with the lowest consumption.\textsuperscript{11}

This yellow-orange carotenoid has even been shown to provide protection for smokers.

In a recent study, scientists evaluated the dietary intake of carotenoids in 1,414 men aged 65 and over and their incidence of age-related macular degeneration. Current smokers who ate the most foods containing **alpha-carotene** (like pumpkin and carrots) were found to have a significantly **reduced** risk of developing macular degeneration.\textsuperscript{39}

Many individuals with age-related macular degeneration experience difficulties when performing activities at night and under low light, such as driving or reading at night.\textsuperscript{40}

A flavonoid found in many berries,\textsuperscript{41,42} **cyanidin-3-glucoside** enhances the quality and function of **rhodopsin**, a light-sensitive protein found in the rod cells of the retina, and actually boosts the ability of rhodopsin to regenerate.\textsuperscript{41,43-45} Rod cells are the eye’s most sensitive cells, allowing us to see in very dim light. **Loss of rod cells is associated with night blindness or reduced vision in low light.**\textsuperscript{46}

A study of healthy volunteers showed that a berry extract concentrate containing **cyanidin-3-glucoside** improved **night vision**, allowing aging individuals to see better in darkness **after just 30 minutes.**\textsuperscript{47}
Summary

Macular degeneration is a major threat to aging individuals.

Several plant compounds have been shown to protect against many of the underlying causes of compromised vision.

Saffron has been shown to provide protection against early macular degeneration.\textsuperscript{15,16,38}

Alpha-carotene can help protect against advanced macular degeneration.\textsuperscript{11}

Supplementing with an array of these plant compounds including lutein, zeaxanthin, and meso-zeaxanthin provides complementary eyesight protection.

Shield Your Precious Eyesight

AT FANTASTICALLY DISCOUNTED PRICES!

Shielding your eyes from destructive ultraviolet sun rays is one of the most effective means of protection against ocular disease.

Consumers often spend hundreds of dollars on just one pair of so-called “designer” sunglasses. Life Extension® supporters can obtain superior protection against damaging solar radiation at a fraction of the price.

SolarShield® sunglasses are recognized as the number-one doctor-recommended sunglasses in the world, with more than 50 million pairs sold to date.

Patented SolarShield® sunglasses with durable polycarbonate lenses and 100% UV protection fit comfortably over prescription eyewear.

Compare the low price to sunglasses sold in stores and see savings exceeding 90%!

SolarShield® is a registered trademark of Dioptics, Inc.

For full product description and to order SolarShield® sunglasses, call 1-800-544-4440 or visit www.LifeExtension.com
Everyday factors can lead to dry, itchy, irritated eyes. **Tear Support with MaquiBright®** is a unique oral supplement that supports your body’s own tear production for continuous, all-day comfort.

The secret is the maqui berry’s rich source of *delphinidins*, a source of support for tear-producing glands. When human subjects took just 60 mg a day of Maqui berry extract, there was a 45% increase in lubricating tear production.¹²

RESEARCH OUTCOMES on Two CANCER DRUGS

BY SHIRLEY GIVENS

The New England Journal of Medicine published results from two clinical trials of drugs for treating prostate and breast cancer.1,2

The studies showed that both drugs have promise in prolonging survival.

But the gains being made are only baby steps. Despite improvements in care, cancer remains the second most common cause of death in the U.S. and worldwide, closely trailing cardiovascular disease.3
**Non-Metastatic Prostate Cancer in Men**

Androgen-deprivation therapy is a prostate cancer treatment that reduces levels of androgens, the predominant sex hormones in men, which include testosterone.

This therapy is most commonly done with drugs that prevent testosterone from being produced in the body and/or blocking testosterone from binding to cellular receptor sites. Androgen-blocking therapy works for many prostate cancers because testosterone and other androgens stimulate the growth of some tumors.

Some prostate cancers do not respond adequately to this type of treatment and the disease continues to progress.

One of the recent cancer studies focused on men suffering from non-metastatic (localized) prostate cancer that doesn’t respond to androgen-deprivation therapy.¹

Researchers studied men with this type of prostate cancer to evaluate whether the drug, darolutamide, could slow the progression of the disease. Darolutamide blocks receptors on cells that respond to testosterone.

More than 1,500 men with prostate cancer were randomized to receive darolutamide or a placebo.

Men receiving the drug (darolutamide) more than doubled the average metastasis-free survival time, from 18.4 months with the placebo to 40.4 months with darolutamide. Men receiving this drug also delayed the progression to pain.

**Metastatic Breast Cancer in Women**

The second clinical trial studied 694 postmenopausal women with hormone receptor-positive metastatic breast cancer.²

This type of cancer has already spread to distant tissues in the body, a sign of a poor prognosis.

Estrogen receptor-positive breast cancers are characterized by the presence of estrogen receptors in breast cancer cells. These estrogen receptors bind to the hormone estrogen that then fuels tumor cell growth.

In this study, subjects were randomized to receive either the widely used aromatase-inhibitor drug anastrozole or a combination of anastrozole with the drug fulvestrant.

Anastrozole blocks an enzyme (aromatase) involved in the formation of estrogen, reducing its levels.

Fulvestrant binds to breast cancer cell estrogen receptors, degrading them, which in turn inhibits processes involved with estrogen-fueled tumor growth.³

The hope was that the combination treatment (anastrozole plus fulvestrant) would have a synergistic effect, bolstering the effect of anastrozole alone.

---

**Need for Adjuvant Therapies**

The study described in this article shows the additive benefits of combining two anti-estrogen drugs as follows:

\[
\text{ANASTROZOLE} \rightarrow \text{block formation of estrogen} \\
\text{+ FULVESTRANT} \rightarrow \text{degrade estrogen-receptor sites} \\
\]  

\[= \text{Increased Median Survival}\]

While meaningful by conventional oncology standards, the fact that 71% of the fulvestrant plus anastrozole group died demonstrates that more needs to be done when battling metastatic breast cancer.

To review a comprehensive strategy that breast cancer patients may consider, log on to: LifeExtension.com/breast
Researchers analyzed the results of the study over a period of more than five years. The group who received anastrazole with fulvestrant had a median survival of 49.8 months, which was significantly higher than the 42-month median survival experienced by the group who received anastrazole alone.

The improvement in survival in the fulvestrant group is even more impressive given that the women received only half the dose of fulvestrant than is currently considered to be most effective. That represents an incremental improvement in the duration of survival with the combination treatment.

Cancer Prevention: An Important Goal

In addition to pursuing more effective treatments, we need to focus on trying to prevent cancer in the first place.

Scientific research has shown that as many as 90% of all cancers are caused by environmental factors or lifestyle behaviors, and are therefore potentially preventable.5,7

Progress in Cancer Treatment

• Cancer is the second-leading cause of death, after heart disease, in the U.S.

• Two recently published studies showed that novel treatments for two types of cancer were improvements over existing treatment.

• A new androgen-receptor blocker drug called darolutamide significantly extended the metastasis-free survival of men with prostate cancer, more than doubling the time to metastasis.

• Addition of the drug fulvestrant, which blocks the action of estrogens in the tumor, to treatment with anastrozole in women with hormone receptor-positive metastatic breast cancer extended survival time a modest amount.

• Despite these and other recent advances, cancer is still a deadly, and dreaded, disease that affects the lives of many millions of people.

• Most cancers are potentially preventable, because modifiable factors such as lifestyle choices, diet, and exercise contribute significantly to reducing risk.

• While medical science makes slow improvements in cancer treatment, people can take steps to reduce the risk for developing cancer in the first place, which is crucial to further reducing the burden of this devastating disease.
Many actions can cut the risk of developing cancer, including:

- Not smoking and avoiding secondhand smoke,
- Limiting fried foods and red meat,
- Moderating alcohol intake,
- Increasing exercise,
- Eating more fruits and vegetables,
- Consuming nutrients that reduce inflammation and activate anti-cancer mechanisms.5

**Summary**

Scientists continue to make slow progress in the search for better treatments for cancer.

Two recently published studies demonstrate that two drug treatments resulted in improved survival rates for prostate and breast cancer.

In one, the drug **darolutamide** for prostate cancer in men **more than doubled** the length of progression-free survival. In the other, women with metastatic breast cancer saw a modest reduction in mortality with a combination treatment with the drugs **fulvestrant** and **anastrozole**.

These improvements are promising but are a long way from a cure. Making lifestyle changes to prevent cancer is vital and even more important for those undergoing treatment or seeking a long-term complete response.

Reducing known causative factors (such as poor diet) slashes one’s risk of developing cancer.

An Alternative to Coffee that BOOSTS MENTAL FOCUS
Sometimes you need a way to clear afternoon brain fog.

Coffee can do the trick, but for many people, drinking coffee later in the day can interfere with sleep, upset the stomach, lead to a jittery feeling, and result in a later “crash.”

There is an herbal alternative.

Scientists have identified a unique *spearmint extract* that, like coffee, helps the brain focus.

It even boosts short-term working memory. But it’s *stimulant-free* and won’t cause any of coffee’s common side effects.

Available in a convenient, *instant spearmint tea*, this extract contains high levels of *phenolics*, health-promoting compounds found in plants, particularly *rosmarinic acid*.

And this spearmint extract goes beyond offering a *mental* boost.¹ ²

A recent, clinical study demonstrated that it also enhances the ability to quickly initiate unplanned changes in direction or speed.³ This can help performance during exercise or sports, and lead to fewer falls in the elderly.
Staying Mentally Sharp

A majority of Americans are very concerned about staying mentally sharp. While many turn to coffee for a daily boost in focus, attention, and concentration, almost two-thirds of consumers report that they are trying to limit their caffeine intake.

In fact, a whopping 64% of men and women in the U.S., and 74% of those over 55, drink coffee daily, in part for the short-term increase in focus it provides.

Researchers recognized the need for a drink that enhances mental focus as quickly as coffee, while being free of caffeine and other stimulants.

Role of Memory in Mental Focus

Working memory is the part of short-term memory that stores information and allows it to be used even while you’re engaged in another mental task. It plays a crucial role in other cognitive abilities that include problem solving and decision making.

If your working memory isn’t in top shape, that will make it harder to focus and concentrate.

Add to this the fact that working memory declines about 10% per decade after age 40, and even faster after age 70.

Nutrients that boost working memory can play a crucial role in being able to focus and concentrate, especially with increasing age.

Also important to cognitive function is spatial working memory. That’s the ability to recall where items are arranged in space, such as the layout of your home or how to get around town.

Researchers investigated many options, and ultimately found that spearmint extract targets all these areas of mental focus and concentration.

Supporting Mental Focus

Scientists have demonstrated in various studies that spearmint extract enhances the underlying elements of mental focus. It can:

- Boost alertness, mood, and vigor,
- Improve working memory and spatial working memory,
- Improve one’s ability to get to sleep at night, and
- In animals, promote the creation of new brain neurons, protect existing neurons, and boost neurotransmitter levels.

A recent study found that spearmint extract also boosts reactive agility, the ability to react rapidly when quick, sudden changes in direction or speed are needed. This type of agility can help prevent falls in the elderly and improve participants’ sports and exercise performance.

Spearmint extract’s effects for cognitive support have been verified in a range of studies.

Attention, Concentration, and Brain Function

Scientists found that just a single 900 mg dose of spearmint extract led to significant improvements in attention and concentration in human subjects in as little as 2.25 hours. With longer-term use, over 30 days, they continued to show these same cognitive benefits.

In one study, 11 healthy adults who were experiencing typical age-related problems with memory took 900 mg of spearmint extract with breakfast for 30 days. The volunteers were given a battery of computerized cognition tests one hour before taking the initial dose. These tests were repeated after four hours, and again after 30 days.

Four hours after the first dose of spearmint extract, average scores showed:

- 46% improvement on a task requiring attention and concentration,
- 121% improvement on a second task requiring attention and concentration, and
- 39% boost in planning ability.
**Thirty days** after the initial dose, average scores demonstrated:

- **35%** improvement on a test of **reasoning**,  
- **125%** improvement on a test of **attention** and **concentration**, and  
- **48%** boost in **planning** ability.

These findings show that supplementation with spearmint extract has both **immediate** and **long-term** benefits for cognitive function.

Next, scientists investigated this extract’s effects on a healthy, young, and active population. In a double-blind study, 142 healthy, recreationally active men and women were enlisted, who took either 900 mg of a proprietary spearmint extract each day for 90 days, or a placebo.

Improvements in sustained **attention** were measured at day 30 and day 90. Scores on cognitive tests requiring complex attention were improved at day seven. Response times for correct answers were also faster.

The study authors concluded that this spearmint extract enhances attention and “improves cognitive performance in a young, active population.”

Improvement in Working and Spatial Working Memory

Turning to effects on memory, scientists enlisted 90 people, averaging 59.4 years of age, who had age-associated **memory impairment**.

Participants in this randomized, double-blind, placebo-controlled study took either 900 mg or 600 mg of spearmint extract or a placebo every day at breakfast for 90 days. The extract was standardized to contain **24% total phenolics** and **14.5% rosmarinic acid**, one of spearmint’s brain-protecting components.

After 90 days, the 900 mg of extract led to an improvement in **working memory** of approximately 15% and a 9% improvement in **spatial working memory**, compared to the placebo.

This suggests, “*that this extract could improve working memory equivalent to that which may have diminished over a decade of life*,” the study’s authors wrote.

What You Need to Know

- Phenolic compounds in spearmint extract have been shown in human studies to significantly improve **focus and attention**, as well as **concentration**, plus working memory and ability to get to sleep at night.
- Preliminary data suggest that spearmint phenolics like **rosmarinic acid** promote the creation of **new brain cells** and protect existing neurons.
- Recent research on humans shows that spearmint extract also improves **reactive agility**, the ability to rapidly respond physically.
- Spearmint extract does all this **without** caffeine or other stimulants, making it a natural and healthy alternative to coffee.
- A spearmint extract delivering high phenolic levels, especially of rosmarinic acid, is now available in an instant, sugar-free spearmint herbal tea. It comes in one-cup, convenient grab-and-go packets for a quick boost in cognitive performance.
AN ALTERNATIVE TO COFFEE THAT BOOSTS MENTAL FOCUS

Making it Easier to Fall Asleep

The results of this study also demonstrated beneficial effects on sleep and mood, both of which help support daily attention, concentration, and focus. Participants in the 900 mg spearmint group reported improvements in their ability to fall sleep. And they were more alert when they woke up.

The improvements were so pronounced that they were similar to those seen with commonly used sleep aids, researchers noted, but without the negative side effects that often come with them.

In addition to boosting daytime alertness and concentration, these effects might halt the longer-term decline in cognitive health associated with reduced sleep. Using a standard psychological-rating scale, improved mood was observed in those taking 900 mg of spearmint extract.

Taken together, all these effects can make a huge difference in an individual’s mental focus and function.

Promotes Brain Neuron Formation

Beyond improving cognition, the phenolics present in the extract promote neurogenesis, the formation of new brain cells.

In cultures of cells from the hippocampus, the brain’s center of working memory, spearmint’s rosmarinic acid significantly enhanced the growth of new cells.

Not long ago it was believed that people stop growing new brain cells after adolescence. But a 2018 study in the journal Cell Stem Cell found otherwise.

Postmortem examination of the brains of people who died at various ages revealed that healthy, older individuals without cognitive impairment or neuropsychiatric disease maintain neurogenesis well into old age.

This has changed medicine’s view of brain aging. Now that scientists know new brain cells are being formed, the focus has shifted to learning how quickly an individual produces them. A person’s neurogenic rate may be vital in determining how well the brain functions and focuses.

Research suggests that spearmint extract provides the brain with support to optimize its potential for neuron creation. This can lead to improved focus and long-term cognitive function, and may help those at risk for age-associated memory impairment.

Increases Neurotransmitter Levels

Spearmint has also been shown to protect existing brain cells and the blood vessels that nourish them. Phenolics in spearmint inhibit the enzyme acetylcholinesterase, which breaks down the memory-associated neurotransmitter acetylcholine.

These phenolic compounds also inhibit harmful oxidative stress. One specific phenolic, rosmarinic acid, was shown to protect key memory centers of animal brains—such as the hippocampus and cortex—against cellular damage from this stress.
Improves Reactive Agility

In a double-blind study that appears to be the first of its kind, scientists recently assessed the effects of spearmint on a connection between mental and physical performance.3

They gave 142 healthy, active volunteers, aged 18 to 50, either a placebo or 900 mg of spearmint extract daily for 90 days. Subjects avoided caffeine for 10 hours before and during the study. Using a special audio-visual device and footplates, researchers evaluated reactive agility, the physical ability to quickly react to a stimulus.3

At days 30 and 90, the spearmint group demonstrated significantly greater reactive agility than the placebo group, showing a faster association between cognition and physical response with spearmint supplementation.3

The study’s author concluded that the spearmint extract appeared to be safe and have potential benefits for athletic performance.3

Another study demonstrated that participants subjectively experienced energy improvement. This double-blind experiment involved 10 healthy individuals who had been sleep-deprived for 24 hours, during which time they had participated in very stressful, antiterrorism training.18

Unlike the placebo group, those taking 900 mg daily of the proprietary spearmint extract containing rosmarinic acid reported increased feelings of energy. They also reported experiencing greater attention and focus. However, the researchers found that the overall results were less than conclusive, and called for further study.18

A Quick Mental Boost

All these successful, human studies employed 900 mg of a spearmint extract containing more than 50 phenolic compounds, standardized to 24% total phenolics and 14.5% rosmarinic acid.

This same dose of the extract is now available in just one serving of a sugar-free, instant spearmint tea.

Researchers achieved this high phenol concentration by using a gentle water-extraction process and an innovative drying technology. This preserves the phenolics and the rosmarinic acid more fully than typical steam-extraction methods.

This herbal tea comes in grab-and-go packets that make one cup of tea in seconds. Just pour the contents into a cup, add hot water, and stir—no steeping required.

This instant refreshment delivers an immediate boost in mental focus and working memory without caffeine, and without the potential for a later “crash.”1,2

Summary

People seeking an alternative to coffee can now get a quick boost in focus, attention, and concentration with a spearmint herbal tea.

Human studies show that phenolics like rosmarinic acid, abundant in spearmint, enhance mental focus and working memory during the day, and improve one’s ability to get to sleep at night.

Early lab data suggest spearmint compounds may promote the creation of new brain cells.

A human study found that a spearmint extract can also increase reactive agility, a brain-muscle reaction that can benefit athletic performance. Another study showed that the extract enhanced feelings of energy.

In human trials the spearmint extract has been shown to be safe, without any adverse side effects.1,2

Available in one-cup, grab-and-go packets that deliver a high concentration of rosmarinic acid and other phenolic compounds, this sugar-free, instant spearmint tea provides an ideal, caffeine-free way to quickly increase mental focus while improving cognitive health.

A good night’s sleep supports a healthy immune response, mental alertness, and more youthful-looking skin.

Three plant-based ingredients in Herbal Sleep PM target the brain’s sleep centers to promote restful sleep patterns.

- **Lemon Balm**: promotes sleep and a sense of calm.
- **Honokiol**: helps induce relaxation to fall asleep faster.
- **Chamomile**: promotes sleep and relaxation.

Take Herbal Sleep PM 30 to 60 minutes before bedtime.

For full product description and to order Herbal Sleep PM, call 1-800-544-4440 or visit www.LifeExtension.com

Astaxanthin is a carotenoid that benefits the brain, heart, skin, and immune system.

Found naturally in seafood and algae, as little as 50% of astaxanthin is normally absorbed in the bloodstream.\(^1\,^2\)

Life Extension® combines 4 mg of astaxanthin with a blend of four different phospholipids, which has been shown to enhance carotenoid absorption by several-fold.\(^3\)

Storing STEM CELLS to Reduce Cancer Treatment-Related Risks

BY DIPNARINE MAHARAJ, MD, FACP, AND BELLA MAHARAJ

With modern advances in treatment, increased awareness, and developments in early detection, the five-year survival rate for cancer patients is steadily rising.

But successful treatments like chemotherapy and radiation come with an increased risk of blood disorders like leukemia.

In other words, treatment for cancer can cause another kind of cancer.

Conventional treatments can also damage one’s bone marrow, leading to immune system suppression.

But now there’s a way for cancer patients to fight back against loss of bone marrow stem cells caused by treatment:

Collecting and storing stem cells before receiving chemotherapy and radiation therapy.

Those cells can later be used to boost immune function and fight treatment-induced cancer, if it occurs.

Healthy people can also store stem cells, which can be used to restore the strength of the immune system should illness strike, and to repair damaged tissues and organs.
The Threat of t-MDS/AML

Patients are often unaware that t-MDS/AML are side effects of chemotherapy and radiation treatment for cancer: But the risks are significant.

A study that reviewed 15 years of breast cancer medical records found that women under 65, previously treated with radiation and/or chemotherapy, have a rate of myelodysplastic syndrome that is nearly 11 times higher than the general population and a greater than five times higher rate of acute myeloid leukemia.2

This increased risk of bone marrow disorders occurring after treatment has been found for nearly all types of cancer.3 A 2018 study of 700,612 adults in a U.S. cancer data registry showed that having chemotherapy increased the relative risk of developing tMDS/AML by as much as 10 times.4 This was true for 22 of 23 cancer types investigated (all except colon cancer).

The bad news gets worse. Myelodysplastic syndrome and acute myeloid leukemia that result from past chemotherapy and radiation can be harder to treat than other cases. The outcomes for patients with t-MDS/AML are poor, with shorter survival times than for patients with MDS/AML unrelated to chemotherapy and radiation.5 As a result, there are very few treatment options for t-MDS/AML.

The treatment that Roberts received, a bone marrow/stem cell transplant from a donor, can succeed.

The Robin Roberts Story

On June 11, 2012, Good Morning America co-host Robin Roberts announced that she was facing her second major health battle in five years.

Robin Roberts had been diagnosed with early-stage breast cancer in 2007 and received chemotherapy and radiation therapy to treat it. Then, at 51, she had been diagnosed with myelodysplastic syndrome (MDS).1

MDS is a rare and often fatal blood disease in which the bone marrow loses its ability to produce mature blood cells, including white blood cells to fight infection and red blood cells to transport oxygen through the body.

MDS following chemotherapy or radiation often transforms into acute myeloid leukemia (AML), a life-threatening blood cancer.

The two diseases are known together as t-MDS/AML (treatment-related myelodysplastic syndrome and acute myeloid leukemia). They are significant and serious complications of cancer therapy.

But Roberts overcame MDS with help from a life-saving bone marrow and stem cell transplant from her older sister. In 2018, she celebrated the sixth anniversary of the transplant, which she considered to be her sixth “birthday.”

This shows the tremendous healing power of stem cells. Concentrated in the bone marrow, they can restore the immune system and repair damaged cells, tissues, and organs throughout the body.
But it’s a complicated procedure that carries an increased mortality risk ranging from 23%-61%. The median overall survival rate from this transplant ranges only from 22%-38%.

The major complication is a disorder called “graft versus host” whereby the donated bone marrow (even from a close relative) begins to viciously attack the recipient’s body.

Treatment for graft versus host involves years of immune suppressing therapies (often using high dose corticosteroid drugs) and sometimes apheresis UV light therapy to weaken the immune response. This buys a few agonizing years before most patients succumb to the chronic autoimmune attacks or the side effects of powerful steroid drugs like prednisone and dexamethasone.

Robin Roberts defied the odds. She was also incredibly lucky that her sister was a compatible donor, which occurs in only 25%-30% of siblings.

The Benefits of Storing Stem Cells

Many patients will not have an optimal donor.

The likelihood of finding an available, compatible donor from national marrow registries varies among different racial and ethnic groups. Whites of European descent have the highest odds (75%); black Americans of all ethnic backgrounds have the lowest (16%-19%); and Hispanics, Asians, Pacific Islanders, and Native Americans fall in the middle (27%-52%).

For most patients diagnosed with treatment-related MDS/AML, there are no suitable options. The best many can hope for is a mismatched donor transplant. But this comes with a high risk of mortality and complications such as graft versus host disease.

The statistics are depressing. But there’s a proactive approach that patients can take so they won’t have to rely on finding a donor and going through a risky transplant: collecting and storing their own stem cells.

This potentially lifesaving procedure is offered at the Maharaj Institute of Immune Regenerative Medicine in Boynton Beach, Florida. Cancer patients travel from all over the country and the world prior to receiving chemotherapy and radiation therapy, to take advantage of stem cell storage.

By freezing their bone marrow stem cells in the Stem Cell Cryobank, cancer patients can save their healthy, immune cell-producing stem cells before they are damaged by chemotherapy and radiation therapy.

Patients might think there is little value in storing their cells after a diagnosis of cancer, because their immune system is already compromised. But the process of moving stem cells from the bone marrow (called stem cell mobilization) before collecting them from the blood was shown to lead to a 7- to 14-fold increase in immune cells and up to a 400-fold increase in stem cells.

These stem cells can be used for a transplant later. Since they’re from a patient’s own body, they’re compatible, leading to the best possible survival outcomes. And there’s no risk of graft versus host disease like there is with a transplant from a donor.

In addition, scientists are constantly developing new and promising immunotherapies, such as chimeric antigen receptor (CAR) T cell therapy, in which a patient’s own immune system cells are genetically modified in a lab so they will attack cancer cells.

One limitation of (CAR) T cell therapy is that the numbers of stem cells and immune cells are low when they are collected after a cancer patient has received chemotherapy or radiation. If a patient has collected and stored stem cells before chemotherapy/radiation, when they are high in number, they are more useful for (CAR) T cell therapy.
A Procedure for Everyone

Collecting and storing stem cells isn’t just for cancer patients.

Our immune system fights cancer and other diseases. But as we age, our immune system gradually weakens. Unfortunately, regular blood tests offered by most physicians do not fully register abnormalities within the immune system.

However, health-conscious individuals can take advantage of advanced methods of measuring their immune systems, giving a better indication of the body’s ability to fight disease.

Such testing is available through The Maharaj Institute, which uses a sophisticated blood test that examines an extensive array of cellular blood markers, then creates an Immune Risk Profile that ranges from no abnormalities to mild, moderate, and severe.

Those with a healthy immune system can collect and store their stem cells in case they are needed to restore their immune health in the future.

For those with an abnormal immune system, a root cause analysis can identify possible reasons for the weakened system. Once deficiencies are corrected, the procedure continues with the gathering and storage of adult stem cells from the bone marrow, along with a maintenance plan to keep the immune system on track.

Doing this can safeguard health and longevity by providing people with two healthy immune systems: one in the body and a backup in the Stem Cell Cryobank.

Hope for the Future

With an impaired immune system, cancer survivors and healthy adults are at an elevated risk for new cancers and other illnesses. They can benefit from measures to correct the deficiencies, have a maintenance plan, and bank and store their stem cells.

When reintroduced into a health-challenged body, adult stem cells taken from the bone marrow have the remarkable potential to repair the immune system and to develop and grow into many different, specialized cell types.11

As stem cell therapy evolves, so will the number of uses that are available for an individual’s banked stem cells. With more than 3,000 U.S. clinical trials using adult stem cell therapies, there is growing evidence to show that an individual’s own stem cells have the capability for growth, repair, and regeneration of damaged cells, tissues, and organs throughout the body.

Currently there are more than 80 medically accepted uses for adult stem cells mobilized from the bone marrow, including the treatment of many blood cancers, bone marrow failures, and immune disorders.

Ideally, everyone would have a healthy immune system stored for the future.

Jared Firestone

From Stroke Victim to Olympic Hopeful

When the left side of 23-year-old Jared Firestone’s body started going numb, he knew something was terribly wrong. But he had no idea he was having a stroke.

In his first year of law school at Benjamin N. Cardozo School of Law in New York City, and following a successful college career as a track and field athlete, Firestone thought he was in perfect health.

In reality, a silent, hidden threat had been lurking in his body his entire life.

The day that Firestone suffered his stroke—October 3, 2013—marked a turning point, setting him on a path that would change his life forever.

Firestone’s symptoms started gradually. First, he noticed that his fingers wouldn’t bend when he tried to turn off his morning alarm. He shrugged it off, thinking his hand had just “fallen asleep.” But by the time he attempted to brush his teeth, he couldn’t use his right arm.

“That’s when I sensed something was really wrong,” said Firestone.

By the time he called his father, a doctor, he couldn’t even form the words to clearly tell him what was happening. But his father had a feeling he might be having a stroke, and told him to get to the hospital right away.

“I thought I’d never be able to feel my body again,” said Firestone.
But he was one of the lucky ones.

Rather than having a “regular” stroke, which can lead to permanent disability, Firestone had suffered a mini stroke (also called a transient ischemic attack or TIA), which typically only produces temporary symptoms.

That’s because while a stroke is caused by a blockage of blood flow in the brain, in a mini-stroke, that blockage is only temporary, making the symptoms temporary as well.

By the next day, Firestone had regained feeling throughout his body.

Testing revealed that he likely had a tiny hole in his heart. The doctors explained that during one of his heartbeats, a blood clot went out of that hole and up to his brain, triggering his mini-stroke.

Since the hole was too small to fix, Firestone was sent home with instructions to take a baby aspirin daily and to avoid high-stress situations.

But Firestone didn’t simply ignore the advice about avoiding stress… he tossed it out the window: Because in the years that have followed, he began competing in one of the world’s most stressful, high-risk sports – all while completing his law degree.

**Finding His Identity**

“The stroke made me want to think outside the box,” said Firestone. “Being a lawyer is a great thing, but I felt like I wanted to do more.”

Firestone’s epiphany came a few months after his stroke, when he was watching the Winter Olympics on television, and he saw a sport called skeleton.

Skeleton is a sledding sport that involves a single person on a sled riding face-first down a winding track at speeds up to 80 miles per hour and under 5 G’s of pressure. There are no brakes or steering mechanisms on the sled, forcing the rider to steer with body movements alone.

One look at skeleton, and Firestone was hooked.

“I always loved sports, and I had competed in track in high school and in college. That was my identity,” said Firestone. “And after the stroke, I realized that was what I wanted to get back to.”

But what does a winter sledding sport have to do with running track? As Firestone learned, sprinting is the foundation of skeleton because getting a good time highly depends on the 50-meter sprint at the top of the chute. The speed of the sprint helps build momentum for a faster race down the track.

“You could be the best driver, but if you don’t have the speed at the start, you’re not going to win,” said Firestone.

**Diving Head-First into Life**

Firestone was invited to a sliding school in Lake Placid, N.Y., where he was literally thrown into the sport.

“There are 20 curves in the chute, and they start you at curve 9,” said Firestone. “They don’t give much instruction other than to not panic and to try to have fun.”

The only protections provided to the riders are ski goggles and an open-faced helmet.

“I took some pretty big hits that first week,” said Firestone. “I got my nose scraped up, but I was still smiling in the end. That’s when I knew this was something I wanted to do.”

While finishing law school, Firestone went on to compete in the regional and national skeleton races and came in 12th at the U.S. Nationals race in 2019.

But as Firestone sets his sights on the 2022 Winter Olympics, he won’t be competing for a spot on the U.S. team. He’ll be racing to represent another country: Israel.

After making a name for himself on the U.S. team, Firestone was approached by AJ Edelman, Israeli Olympic skeleton racer in the 2018 Winter Olympics, about racing for Israel.

It was an easy decision.

“I’ve always had a strong connection to the Jewish community. I went to Jewish day school growing up, and I’ve been to Israel numerous times. Being able to represent Israel was something that was important to me,” said Firestone.

After three years with the U.S. team, Firestone obtained his Israeli citizenship. Now, starting this October, he’ll be donning the signature Star of David from the Israeli flag.
Preparing to Be the Best

As Firestone looks to the 2022 Winter Olympics, he prepares his body with a balance of training and conditioning, rest, and supplementation.

“The sport is pretty demanding because it takes both a physical and mental toll on you,” said Firestone. “In addition to the physical beating you might take while sliding, you train like a sprint athlete at the same time.”

In the off season, Firestone focuses on workouts that build up strength and conditioning. During the competition season, he focuses on allowing his body to rest and recover from the races. He also incorporates specific supplements into his routine.

For example, because Firestone has problems with cramping, he takes hydration products with electrolytes. “These help me with my endurance, and give me the confidence that I won’t cramp,” he said.

Since he has a fast metabolism, he takes omegas-3, 6, and 9 in order to give him the energy he needs to get through his workouts.

In addition to a multivitamin, he also takes mushroom extract, glutamine, and bone broth protein – various supplements that he says help provide natural energy and help him focus.

A Deeper Message

While making it to the Olympics would be the biggest accomplishment of Firestone’s life, his message extends beyond his own personal goals.

Growing up, Firestone saw the 2005 movie, “Munich,” produced and directed by Steven Spielberg, which tells the tragic, real-life story of a Palestinian terrorist group that infiltrated the Olympic Village in West Germany in 1972 and murdered 11 members of the Israeli Olympic team.

“Being able to represent Israel on the world stage would bring me so much pride,” said Firestone. “To me it is extra special because of being able to make the statement that we’re not going away. Terrorism is not going to scare us.

“That belief resonates throughout sports, history, and life,” said Firestone. “Now that I’m representing Israel, spreading that message makes me more motivated than ever to do this.”

Sacrifices are Worth It

Following your dreams is never easy. It takes time, dedication, sacrifice, and as they say in Israel, chutzpah.

For Firestone, it has meant putting his law career on the back burner. The competition season lasts six months, and, as Firestone explains, no firm is willing to hire someone who is going to be away for half the year.

While the Israeli Skeleton Federation has been around for 16 years, they don’t have a lot of resources, which means the burden of the sport’s expenses – which run in excess of $30,000 per year – falls to Firestone.

“I knew when I made this choice to compete for Israel that I couldn’t have a life focused on my legal career, traveling, or hanging out with friends,” said Firestone. “There are sacrifices, but to me it’s worth it.”

Firestone works as a realtor and has started his own private law firm so that he can take on various legal work during his off season. He’s also actively looking for sponsors.

“Making it to the Olympics would be the ultimate accomplishment for myself,” said Firestone. “But on top of that, being able to bring joy and pride to my community here and around the U.S. and Israel makes all the hard work and sacrifice worth it.”

* These statements have not been evaluated by the Food and Drug Administration. This product is not intended to diagnose, treat, cure or prevent any disease.
Cabbage may resemble lettuce, but that's where their similarities end. While lettuce contains more water, cabbage (a part of the cruciferous family of vegetables) has twice the amount of dietary fiber, plus more protein.

There are at least 15 different varieties of cabbage that range in color from green to red to purple, and their leaves can be either smooth or wrinkled. There are many reasons to include cabbage as part of a healthy diet. Consuming cabbage can contribute to one’s overall health.

Traditionally, in folk medicine, cabbage has been used to help treat a range of health problems, including constipation, headaches, and skin disorders.

More recent research has revealed that it contains compounds that can help protect against the dangers of cancer, radiation therapy, and heart disease.

**Heart Health**

Cabbage—especially red cabbage—contains a type of flavonoid called anthocyanins, which are the pigments that give cabbage its bright purple color. Eating foods higher in anthocyanins has been linked to a reduced risk of heart disease.¹

Higher anthocyanin intake has also been associated with lower arterial stiffness and lower central blood pressure in women.² Arterial stiffness contributes to cardiovascular diseases, and is associated with systolic hypertension, coronary artery disease, stroke, heart failure, and atrial fibrillation—all leading causes of death.³

**Cancer Prevention**

Studies have shown that cabbage contains compounds that can help prevent numerous types of cancer, including breast, prostate, bladder, and colon cancers. This is due in part to the numerous anti-cancer activities of these compounds, which include stimulating the activity of enzymes that inhibit tumor growth.

**Gut Health**

Cabbage can help improve digestive health because it is a good source of insoluble fiber, which helps add bulk to stools and promotes regular bowel movements. It also contains soluble fiber, which can help increase good bacteria in the gut.

At less than 20 calories per half cup, cabbage makes an excellent addition to a healthy diet. It is perhaps best known as the main ingredient in coleslaw. It also tastes good sliced, brushed with extra virgin olive oil, sprinkled with salt and pepper, and roasted in the oven.

*Some restrictions apply
NAD+ levels plummet with age but increase in response to nicotinamide riboside.

Optimized NAD+ Cell Regenerator™ combines 250 mg of nicotinamide riboside with resveratrol and other plant extracts.

For those already taking resveratrol, we also offer NAD+ Cell Regenerator™ that provides 250 mg of nicotinamide riboside.

The only online source of these NAD+ formulas is LifeExtension.com (or by calling 1-800-544-4440).

* For pricing available to readers of this magazine, call 1-800-544-4440 or visit LifeExtension.com/NAD
WHAT’S INSIDE

7 LOSING THE WAR ON CANCER
Death rates from cancer are down, but the number of Americans dying each year is higher than ever. A new method enables people to achieve higher blood levels of anti-cancer nutrients found in cruciferous vegetables.

48 IMPROVE VISUAL ACUITY
Plant carotenoids can lower risk of advanced macular degeneration by 41%. The addition of the spice saffron improves visual acuity as measured on a standard eye chart.

24 HOW OSTEOPOROSIS ACCELERATES AGING
As bone decays, harmful growth factors are released that facilitate cancer cell propagation and contribute to vascular calcification.

58 RESEARCH OUTCOMES ON CANCER DRUGS
Two drugs are demonstrating benefits in treating prostate and breast cancers.

68 COFFEE ALTERNATIVE BOOSTS MENTAL FOCUS
A caffeine-free tea beverage has been shown to improve concentration, boost short-term working memory, and clear brain fog.

78 CANCER PATIENTS SHOULD BANK THEIR STEM CELLS
Chemotherapy inflicts damage on bone marrow stem cells vital for immune function. Cancer patients should store their bone marrow stem cells prior to conventional treatment.
